

## Studie zur Auswirkung von Geschlechterquoten in der Wissenschaft

24.09.2015

Die European Molecular Biology Organization EMBO und die Robert Bosch Stiftung haben eine Studie zu der Wirksamkeit von Quotenregelungen in der akademischen Welt veröffentlicht.

## Gender quotas in academia - Challenges and opportunities

*Authors of a new report have examined the use of gender quotas to increase the number of women at the highest career levels in academia. "Exploring quotas in academia", a report of a study conducted by EMBO in collaboration with the Robert Bosch Stiftung, looks at the potential benefits and challenges that could arise from the use of quotas as one way to achieve better gender balance in academia. The report describes options for introducing quotas and provides information for decision makers who might consider implementing them.*

After conducting interviews with a wide range of stakeholders, the authors organized a closed workshop in Berlin, where options for the use of gender quotas were analyzed. The working group included gender researchers, heads of research institutes, funders and scientists. They discussed measures such as cascade models for hiring, quotas for the composition of committees, and equal success rates in funding schemes.

"There will be no perfect system to assure gender balance in academia and other research organizations," said Michele Garfinkel, Manager of the EMBO Science Policy Programme. "Some administrators and politicians may want to use quotas but this is not straightforward," added Sandra Bendiscioli, Programme Officer. "Quotas require sensitive implementation. Moreover, they are not sufficient. Further changes in academic settings are necessary to assure that everyone has a fair chance."

"The cascade model can be an effective type of quota setting," commented Gerlind Wallon, EMBO Deputy Director. The cascade model envisages flexible quotas for female participation at various levels: The quota is calculated on the percentage of women at the level immediately below. "This seems a reasonable method that takes into account the number of available, qualified candidates. I would call this a smart quota," added Wallon.

Quotas can produce an immediate increase of female representation in higher academic positions. Quotas, however, do not address two fundamental problems: significantly more men than women choose scientific and/or technology-based careers in the first place and, if women do choose this path, they tend to leave academia early.

Ingrid Wüning-Tschol, Senior Vice-President at the Robert Bosch Stiftung: "Gender inequality is a critical issue in academia. To increase the number of women at the highest career levels, every possible solution should be considered. Quotas are one potentially powerful option".

A full list of participants in the project is available in the report. Gerlind Wallon, Sandra Bendiscioli and Michele Garfinkel from EMBO are the authors of the final report:
